Appeal assistant - demo and capstone guide

Fictional capstone training case. All identities, references and transactions are invented.

1. Your demonstration case

Start with Case A only

Case A: Arun Demo Agarwal; invented PAN DEMPA1234Z; AY 2024-25; returned income Rs.12,00,000; assessed income Rs.17,00,000; disputed expense addition Rs.5,00,000; demand Rs.2,02,800; appeal fee Rs.1,000.

The documents are invented, readable PDFs designed for this app. No payment or government filing took place. Do not use them on the real e-filing portal.

Files to load using Load PDFs

Load only 01_Assessment_Order.pdf, 02_Assessment_Computation.pdf, 03_Demand_Notice.pdf and 04_Client_Return_Computation.pdf from Case_A_Business_Expenses.

Files to consult separately

05: synthetic appeal-fee challan; 06: service record; 07: reply record and point-3 text; 08: expense evidence; 09: return acknowledgment. The app does not have dedicated challan/receipt parsing. Enter those details manually. Do not load every PDF indiscriminately.

Second assessment example

Case B is an independent taxpayer with a bank-reconciliation issue. Start New case before loading its three PDFs. It intentionally lacks supporting reconciliation and appeal drafts. Never mix Case A and Case B; the identity checks should block a mixed case.

Use the checked figures

Case A: tax Rs.3,22,500 + cess Rs.12,900 + illustrative interest Rs.46,800 - TDS Rs.1,79,400 = demand Rs.2,02,800. Computations assume a valid old-regime election and the constructed interest assumptions stated in the sample. These are not a general tax calculator.

2. Run the app - one step at a time

1. Extract the package. Open Application_Source. Run SETUP_WINDOWS once, then START_WINDOWS. Python is required. Your existing app folder can also be used.

2. Click New case, then Load PDFs. Choose the four Case A input PDFs listed on page 1.

3. Check name, PAN, AY, assessed income, addition, demand, returned income and TDS against the sample documents. The sample has been tested against the extractor.

4. In tab 2, Order, enter the service date 25/09/2026 from document 06. It is a manually confirmed fictional service date, not an extracted issue date.

5. In tab 7, Verification, enter intended filing date 05/10/2026 and place Kolkata. The prototype due-date indicator should show 25/10/2026 with no delay. Keep the supplied demonstration dates, even if recording on another day.

6. In tab 4, Taxes paid, confirm Yes for tax on returned income paid in full, on the fictional TDS-covered assumption. Check other answers manually.

7. In tab 5, Facts and grounds, replace the CONFIRM placeholder. You may paste Expected_Output/Statement_of_Facts.txt and Grounds_of_Appeal.txt. Document 07 also gives the replacement for point 3. No hearing denial is claimed in this case.

8. Review the document list. Select No for additional evidence only because the constructed evidence was already referenced in assessment. Select No for other pending appeals for this invented case.

9. In tab 6, Filing, enter: Rs.1,000; BSR 0000000; date 05/10/2026; challan serial 00001. These identifiers are synthetic. Do not pay Rs.1,000 for the demo.

10. Finish all edits. In Reference, set service checked = Yes and facts/grounds/figures reviewed = Yes. Set the final-review answer last: later material edits reset it.

11. Save draft. Export Form 35 PDF. Resolve any remaining messages. Use Export facts / grounds to obtain separate editable text files. Inspect the PDF.

12. If needed, open Expected_Output/Reviewed_Demo.f35.json to see a prepared example. It contains no portable source-document links; reload the four Case A PDFs to inspect source text, then reconfirm final review.

3. Record the demonstration video

1. Open the app and the fictional folder. Close real client material and distracting windows.

2. Use a screen recorder capable of showing your webcam and desktop together. Test a short clip first. The course requires your face and technical content in the video.

3. Introduce your name, problem, project title and course learning used. Use Expected_Output/Video_Script.txt as speaking notes.

4. Demonstrate PDF loading, extracted fields, service-date entry, editing facts/grounds, challan entry, review confirmation and export. Show the final PDF.

5. For AI demonstration, install/run Ollama and a downloaded local model first. Enter the model name under AI draft (local), generate, inspect review notes and apply. This is optional: do not claim generative AI ran if you only used template mode. The app has no live judgment research.

6. Explain that the app prepares documents; the actual appeal is filed separately on the income-tax portal. AI drafts, references and legal positions need human review.

7. A clear 5-7 minute capstone video is my suggested length. Your supplied course document does not prescribe a capstone video length; follow any later batch instruction.

8. Replay the recording. Check face, screen, sound, file names and absence of client data. Export as MP4.

9. Upload to YouTube as Unlisted or Google Drive with accessible viewing permission. Test the video link from a signed-out/incognito browser. Use only synthetic content.

Course deadline

Your supplied AICA Level 2 Ver 5.0 course document requires individual capstone submission within 10 days of course completion. The end date of your batch has not been supplied, so no personal deadline is calculated here.

4. Upload your project to GitHub

1. Sign in to GitHub or create your own account.

2. Open https://github.com/aiinicai/AICA-Level-2-Projects and click Fork, then Create fork. This creates your personal copy.

3. Create an outer folder named AICA-L2-Batch-(XXX)-Rajat-Agrawal, replacing XXX with your actual batch number, following the naming convention supplied by ICAI.

4. Inside it put: a root README.md; Application_Source; the two fictional case folders; Expected_Output; this guide; and a small Video_Link.txt with the final viewing link. The video itself may remain hosted externally.

5. Exclude virtual environments, model weights, real case PDFs, confidential saved drafts, credentials, __pycache__, build output and large executables. Keep source code and instructions.

6. In your fork choose Add file > Upload files. Drag the outer project folder, preserving its structure. The pack contains fewer than 100 files before your video is added.

7. Enter a message such as Add Rajat Agrawal Form 35 capstone and click Commit changes.

8. Choose Contribute > Open pull request. Base: aiinicai/AICA-Level-2-Projects, main. Compare/head: your fork, main.

9. Title: Add AICA Level 2 Capstone - Rajat Agrawal - Form 35 Assistant. Explain the problem, offline template mode, optional local AI, fictional demo and verification. Click Create pull request.

10. Copy the project-folder link and pull-request link. ICAI controls review and merging. Keep monitoring comments; update your fork if requested. Do not delay the course submission simply waiting for a merge unless your batch specifically requires it.

5. Complete the capstone submission

1. Check your batch WhatsApp/DLH instructions for the current submission form and any additional requirements. The supplied course document gives https://forms.gle/cucnBGn34bVHFaxt9.

2. Keep ready: your name, membership number, batch number, project title, short description, GitHub project link, pull-request link and accessible demonstration-video link. Enter the actual fields asked by the form; these are preparation items, not a claim about its live field layout.

3. Submit the form within your batch deadline. Save the response/confirmation if offered. Keep a screenshot or PDF for your records.

4. Check GitHub notifications for review comments. Complete any requested changes. The repository owner decides whether to merge.

Suggested project description

Python desktop prototype for preparing a working Form 35 appeal document from readable assessment PDFs. It extracts data, provides editable template drafts, requires service-date and professional review confirmation, and exports Form 35 and narrative text. Optional local Ollama integration supports generative drafting. Demonstration uses synthetic records. The prototype does not file an appeal or provide verified case-law research.

Final checklist

App runs on your laptop; sample case output checked; review confirmations understood; video shows face and screen; no client data; GitHub pull request created; video link accessible; submission form completed; evidence retained.

Sources and limits

Course requirements: your supplied AICA Level 2 Ver 5.0 PDF, pages 5-6 and Annexure D; your GitHub upload guide. Fee/payment reference: https://www.incometax.gov.in/iec/foportal/help/statutory-forms/popular-form/form35-um and /form35-faq. Old-regime slab reference: Income Tax Department individual tax-slab guidance. The sample is constructed training material, not an issued order or payment receipt. Portal field limits may differ from this prototype; check the real form when working on real appeals.
